

HOMOLOGATION & SELF- CERTIFICATION

TECHNICAL COMPLIANCE MANAGEMENT

YOUR GLOBAL MOBILITY ENGINEERING EXPERTS

The sheer number of approval procedures requirements which need to be adhered to is overwhelming. What makes things more difficult is the fact that they are constantly changing. But who said that you would have to handle this challenge alone? Why not work with an expert who can do this work for you?

Homologation is a comprehensive approval procedure that verifies (based on approval regulations), whether the performance characteristics of delivery items are such that they can be approved, and a certificate of homologation obtained. This is becoming increasingly important, especially for the automotive industry.

To be eligible for registration, vehicles must be configured in such a way that they comply with market-specific legal requirements.

Self-Certification is a part of the homologation process for specific markets, where the OEM must prove the technical compliance and legal conformity by itself

Overview of our services:

- Validation of the manufacturer's legal compliance internally for every vehicle
- Management of the proving process (Planning test and proving test results, evaluating function codes, analyzing technical drawings, creating other forms of evidence)
- Comparison > technical parameters of the parts/functions with the legal requirements
- Documentation of the outcomes in Self-certification reports
- Examples: radii of outer edges, deviation speedometer, theft protection, flammability of interior of materials
